1. My programming partner is Aaron Pabst. My partner submitted the assignment.
2. Me and my partner actually didn't switch roles this assignment. I would have preferred to switch a lot more.
3. Yes I plan on working with my partner again because we got along well, he was cooperative and our schedules seemed to work very well. The only thing I hope to fix if we work together again is to be able to do the typing rather than just navigate.
4. My implementations would have differed if I had used a java List instead of a basic array in a few ways.
  - a. Arrays are faster than List's
  - b. Arrays keep data in a contiguous data chunk which lists do notIn some ways Arrays are better than lists but there are cases in which lists were more convenient than an array. The Reason why is because Lists interfaces offer more flexibility than an array.
5. I think that the Big-O method in contains would be if the object that's being searched is not "contained" in the list.

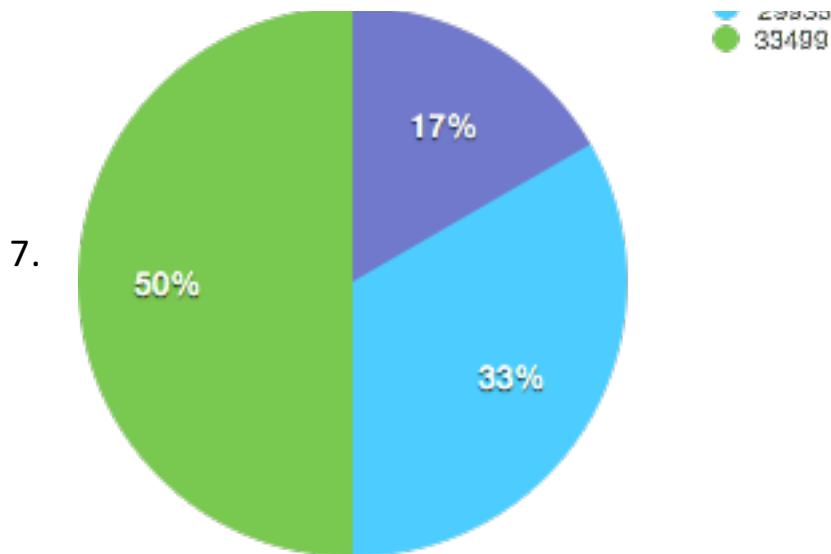

They actually took much longer than I thought they ever would have, WOW.

Pie Chart

● 27371  
● 29935

The computer was too slow for any bigger.

8. This assignment took me and my partner approximately 12 hours. The worst case it would probably take way longer than the charts from above.
